

AfriMart Sales Performance

Insights & Recommendations Report

Excel Dashboard Project | Data period: Jan 2024 – Dec 2026

Prepared October 2026

1. Executive Summary

AfriMart’s 700 recorded transactions across 10 African markets and 7 products generated ₦10.45 billion in revenue and ₦2.10 billion in profit, a blended margin of 20.1%. Revenue grew 22.9% from 2024 to 2025, then fell 9.8% in 2026 on the data as recorded.

The business is highly concentrated in one product. Rice (50kg Bag) delivers 58.8% of revenue and 45.5% of profit, yet carries one of the thinnest margins (15.6%). The highest-margin products, Mobile Data Bundle (40%) and Garri (33%), contribute only 8.5% and 3.0% of profit. Nigeria leads revenue but has the second-lowest margin, because its profit depends more heavily on rice than any other market.

2. Overview

The project analyses AfriMart sales to show where revenue and profit come from, how performance moves over time, and which products and markets deserve attention. The Afrimart KollyBright Dashboard, built in Excel, brings this together in three KPI cards and six charts (revenue by country, profit by product, units by product, revenue trend over time, monthly sales performance and the top 5 products by profit), with Country and Year slicers for filtering.

Figure 1: The AfriMart KollyBright Dashboard (restyled for this report). All values are in Naira (₦).

Total Revenue	Total Profit	Profit Margin	Units Sold
₦10.45B	₦2.10B	20.1%	1,017,885

3. Methodology

- Source:** AfriMart_Sales_Dataset.xlsx, “Data” sheet (700 rows: Country, Product, Units Sold, Revenue, Cost, Profit, Date).
- Data quality checks:** no missing values, no duplicate rows, no negative profits; Revenue – Cost = Profit holds on every row.

- **Analysis:** Excel Pivot Tables and Pivot Charts fed the dashboard, filtered with Country and Year slicers (revenue by country, profit by product, units by product, yearly and monthly trends, top 5 products). Margin, revenue share and profit share were calculated for this report.
- **Scope:** the “New Data” sheet (525 rows dated 2026–2027) is not part of the dashboard and is excluded from the findings; see Section 5.

4. Findings

4.1 Products

Product	Revenue (₦)	Profit (₦)	Margin	Rev %	Profit %
Rice (50kg Bag)	6.14B	956M	15.6%	58.8	45.5
Palm Oil (5L)	2.27B	605M	26.7%	21.7	28.8
Mobile Data Bundle	447M	179M	40.0%	4.3	8.5
Detergent (1kg)	547M	141M	25.7%	5.2	6.7
Cement (50kg)	699M	112M	16.0%	6.7	5.3
Garri (Cassava Flour)	186M	62M	33.3%	1.8	3.0
Bread (Family Loaf)	156M	45M	29.2%	1.5	2.2

Rice and Palm Oil together deliver 74.3% of profit, and the top five products deliver 94.9%. The remaining two products, Garri and Bread, add just 5.1%.

Units tell a different story: Detergent (156K), Garri (155K) and Palm Oil (151K) sell the most units, while Rice ranks sixth on volume (137K) but first on revenue because of its 45,000 unit price.

4.2 Countries

Nigeria (₦1.62B), Tanzania (₦1.25B) and Côte d'Ivoire (₦1.16B) lead on revenue. By profit, Nigeria leads (₦303M) with Côte d'Ivoire and Tanzania close behind (about ₦237M each). Senegal is the smallest market (₦667M) but earns the best margin (22.2%); Nigeria's margin is 18.7% and Tanzania's 18.9%.

4.3 Trends over time

Year	Revenue (₦)	Profit (₦)	Margin
2024	3.13B	629M	20.1%
2025	3.85B (+22.9%)	763M	19.8%
2026	3.47B (-9.8%)	708M	20.4%

Pooled across the three years, August is the strongest month for revenue (₦1.25B) and December the weakest (₦676M), while units peak in February (109K). Across the full period, Q3 is the strongest quarter (₦3.22B) and Q4 the weakest (₦2.27B). In 2024 and 2025, November and December were the two lowest months of each year (roughly 137M–183M each), while 2025 peaked in August–September (about 444M–466M a month).

5. Key Insights

- **Rice is both the engine and the risk.** Every one of the top seven country-product profit pools is Rice. A pricing, supply or FX shock on this one product would move the whole business.
- **Margin is set by product, not by country.** Each product sells at a single fixed price and cost ratio across all 700 rows (e.g. Rice always 15.6%, Mobile Data always 40%). Country margin differences, such as Senegal at 22.2% versus Nigeria at 18.7%, come entirely from product mix. Rice is 59% of Nigeria's profit but only 26% of Senegal's.
- **High-margin products are under-scaled.** Mobile Data Bundle earns 40% and sells nearly as many units as Palm Oil, yet adds only 4.3% of revenue. Garri and Bread earn 29–33% but are small.
- **Seasonality is real.** Q3 peaks and Q4 slumps in 2024 and 2025 (Q4 2026 breaks the pattern, but see the date caveat below), so Q4 plans should account for that pattern.

- **Data points to verify before presenting the 2026 decline.** 57 of the 2026 transactions (₦1.12B revenue) carry dates after the date of this report, and Nov–Dec 2026 show ₦409M and ₦356M against 137–183M in the same months of 2024 and 2025. The –9.8% change should be treated as provisional until the dates are confirmed. The “New Data” sheet also contains 2026–2027 rows that overlap 2026 in the main sheet but share no identical records; its relationship to “Data” should be clarified.

6. Recommendations

- **Reduce rice dependence.** Set a target for non-rice products to reach 50% of profit, and track rice share as a standing KPI on the dashboard.
- **Scale Mobile Data, Garri and Bread.** Push these in markets where they are weakest (for example Mobile Data in Ghana, 3% of profit, and Kenya, 5%) to lift blended margin without needing more volume.
- **Review Nigeria’s mix.** It is the largest market but has the heaviest rice reliance; shifting even a small share of sales to Palm Oil or Mobile Data would raise margin materially.
- **Protect Rice margins.** At 15.6%, small cost increases erode profit quickly. Review supplier terms and pricing for Rice and Cement (16.0%).
- **Plan for Q4.** Run Q4 promotions and stock planning around the November–December dip, and build on the Q3 peak.
- **Improve the dashboard.** Add margin % and rice-share KPIs, a country-by-product view, a year-over-year growth card. Confirm the date range and the role of the “New Data” sheet.
